AHELP for CIAO 3.4

atanh

Context: slangrtl

Jump to: Description See Also

Synopsis

Compute the inverse–tanh of a number

Syntax

\[ y = \text{atanh} \ (x) \]

Description

The atanh function computes the inverse–tanh of a number and returns the result as an array. If its argument is an array, the atanh function will be applied to each element and the result returned as an array.
