5.17_V2.0 SWITCH FROM BEP B TO BEP A

Last Revised: May 26, 2016
Filename: switch_bepb_a

BRIEF FUNCTIONAL DESCRIPTION:

This is a contingency procedure to switch from using BEP B to using BEP A.

The sequence of actions will be:

1. Issue power-down command for FEPs and video boards
2. Select BEP A
3. Cold boot BEPs
4. Verify BEP A boots from SW TLM
5. Check HW LEDs
6. Check SW LEDs
7. Issue power-down command for FEPs and video boards

The procedure does a cold boot to get the instrument into a known state, so if there were patches loaded into BEP A they will be lost. The operator should be cognizant if patches must be subsequently loaded. The final power-down command ensures that the control register in the newly active BEP reflects the current FEP power status.

ASSUMED INSTRUMENT STATE:
Assumes that DPA A & B are on.
Assumes BEP B is functional and can accept a power-down command.

SPECIAL INITIAL CONDITIONS:
None.

OPERATIONAL CONSTRAINTS/CAUTIONS:
Any patches loaded into BEP A will be removed as a result of this procedure. This procedure resets the focal plane temperature setting.

REFERENCES:

CHANGE HISTORY:

V1.0

- Initial version, based on switch_bepa_b V2.1

- Added warnings about focal plane temperature setting.

- Minor formatting change to table.

- Added steps to power down FEPs and video boards before and after the switch.

- Added intiial state for BEP B.

V2.0

- ACIS team signed-off version.

This page is intentionally blank
