

4.30_V1.0 TURN ON DEA B (realtime version)

Last Revised: July 21, 2015

Filename: deab_on

BRIEF FUNCTIONAL DESCRIPTION:

This is an “atomic” procedure which powers up the DEA side B and tests its 10 video boards. It should be safe to execute under any condition except a spacecraft power or thermal emergency. The telemetry verifiers for the “Enable” and “On” can be confusing depending on if either side of the DPA was on before the procedure started. If both sides of the DPA were off, the Enable and On will read Enabled and On even though both sides of the DPA are off. Once the the On command has been executed the Enable and On will still read Enabled and On. The only sure way to tell is to check the input current and the voltages. If one side of the DPA happened to be on, then the Enable and On would correctly read disabled and off before this procedure is run and would change state after the DEA was powered.

The sequence of actions will be:

1. enable and turn on DEA power supply side B
2. verify that DEA A is off
3. power up all 10 video boards
4. execute two bias-only science runs to capture video housekeeping
5. power down the 10 video boards

ASSUMED INSTRUMENT STATE:

Assumes that the PSMC has power from the spacecraft.
Assumes that DEA A is off.

SPECIAL INITIAL CONDITIONS:

OPERATIONAL CONSTRAINTS/CAUTIONS:

After execution, *FP temperature is set to 0 K,*
and *DEA interface A/D is in 8-bit mode.*
