

chandra.saotrace.coords(l)

chandra.saotrace.coords(l)

## NAME

chandra.saotrace.coords – transform between various coordinate systems

## SYNOPSIS

```
coords = require ('chandra.saotrace.coords')

el, az = coords.osac_polar_2_osac_elaz( theta, phi )
theta, phi = coords.osac_elaz_2_osac_polar( el, az )

theta, phi = coords.osac_polar_2_HSC11( theta, phi )
theta, phi = coords.HSC11_2_osac_polar( theta, phi )

el, az = coords.pitchyaw_2_osac_elaz( pitch, yaw )

x, y = coords.osac_elaz_2_xy( el, az, z )

theta, phi = coords.osac_polar_2_raygen_polar( theta, phi )

theta, phi = coords.raygen_polar_to_MSC( theta, phi )

theta, phi = coords.MSC_to_raygen_polar( theta, phi )

el, az = coords.raygen_polar_2_raygen_elaz( theta, phi )
theta, phi = coords.raygen_elaz_2_raygen_polar( el, az )
```

## DESCRIPTION

The **chandra.saotrace.coords** library provides routines to convert between various coordinate systems. Currently, it primarily handles source position coordinates.

## CONSTANTS

sec2rad  
factor to convert from seconds of arc to radians  
min2rad  
factor to convert from minutes of arc to radians  
deg2rad  
factor to convert from degrees to radians  
rad2deg  
factor to convert from radians to degrees

## FUNCTIONS

osac\_polar\_2\_osac\_elaz  
Convert from OSAC polar coordinates to OSAC elevation and azimuth. All angles are in radians.  
Input angles are reduced such that  $0 \leq \phi < 2\pi$  and  $0 \leq \theta \leq \pi/2$   
osac\_polar\_2\_raygen\_polar  
Convert from OSAC polar coordinates (which indicate the direction that the ray is travelling to) to **raygen** polar coordinates, which indicate the direction the ray is travelling from. All angles are in radians.  
osac\_elaz\_2\_osac\_polar  
Convert from OSAC elevation and azimuth to OSAC polar coordinates. All angles are in radians.  
Input angles are reduced to be  $0 \leq \angle \leq \pi/2$ .  
osac\_polar\_2\_HSC11  
Convert from OSAC polar coordinates to HRMA Left Handed Spherical Coordinates (AXAF-HSC-1.1). All angles are in radians.

chandra.saotrace.coords(l)

chandra.saotrace.coords(l)

HSC11\_2\_osac\_polar

convert from AXAF-HSC-1.1 to OSAC polar coordinates. All angles are in radians.

raygen\_polar\_to\_MSC

Convert from **raygen** polar coordinates to Mirror Spherical Coordinates. All angles are in radians.

MSC\_to\_osac\_polar

convert from Mirror Spherical Coordinates to **raygen** polar coordinates. All angles are in radians.

pitchyaw\_2\_osac\_elaz

convert from XRCF pitch and yaw to OSAC elevation and azimuth. Pitch and Yaw are in minutes of arc; the output angles are in radians.

osac\_elaz\_2\_xy( el, az, z )

convert from OSAC elevation and azimuth to OSAC X and Y at a particular OSAC Z. All angles are in radians.

raygen\_elaz\_2\_raygen\_polar

( theta, phi ) = raygen\_elaz\_2\_raygen\_polar( el, az );

Convert from **raygen** elevation and azimuth to **raygen** polar coordinates. All angles are in radians. Input angles are reduced to be  $0 \leq \text{angle} \leq \pi/2$ .

raygen\_polar\_2\_raygen\_elaz

( el, az ) = raygen\_polar\_2\_raygen\_elaz( theta, phi );

Convert from **raygen** polar coordinates to **raygen** elevation and azimuth. All angles are in radians. Input angles are reduced such that  $0 \leq \text{phi} < 2\pi$  and  $0 \leq \text{theta} \leq \pi/2$
