

**NAME**

scatter – apply a scattering distribution to incoming photons

**SYNOPSIS**

scatter [*option=value*]

**OPTIONS**

Parameters for scatter.par

*input string*

Input photon stream in bpipe format. The string 'stdin' causes scatter to read from standard input.

*output string*

Output photon stream in bpipe format. The string 'stdout' causes scatter to write to standard output.

*logfile string*

Log file. The string 'stderr' causes scatter to write the log to standard error.

*seed1 integer*

The first seed for the random number generator. It must be in the range [1,214748339].

*seed2 integer*

The second seed for the random number generator. It must be in the range [1,214748339].

*block integer*

The random number block to start at. It must be in the range [1,1048575].

*scatter\_db string*

Database of scattering distributions. This is an RDB formatted file. See “FILES”

*mirror\_db string*

Database of mirror positions. This is an RDB formatted file. See “FILES”

*scat\_iter\_lim integer*

Maximum number of iterations to try to scatter a photon.

*in\_plane boolean*

Apply the in plane scatter.

*out\_of\_plane boolean*

Apply the out of plane scatter.

*min\_cumulative\_probability real*

Minumum cumulative probability.

*max\_cumulative\_probability real*

Maxumum cumulative probability.

*shell integer*

Mirror shell number.

*surf\_no integer*

Mirror surface number; 1=P, 2=H.

*theta real*

Default value for theta, in arcseconds

*phi real*

Default value for phi, in arcseconds.

*debug string*

Print various types of debug information to *logfile* or enables non-standard operation. The strings listed below may be given singly or in a colon separated list.

*angles*

Prints photon id, in-plane, and out-of-plane scatter offsets.

scatter(l)

scatter(l)

extrapolated

Prints photon id, energy, random number, and sin of the incident angle.

offzone

Prints photon id and z position.

offzone2

Prints photon id, z position, and offset from nearest mirror section.

help boolean

Print brief usage information and exit.

usage boolean

Print usage information and exit.

version boolean

Print version and exit.

mode string

Mode of operation.

## DESCRIPTION

scatter takes an input bpipe photon stream and applies a offset to the photon direction. The offset is read from the *scatter\_db*, interpolated between values in the *scatter\_db*, or extrapolated from the *scatter\_db* depending on the situation.

Required fields in the input bpipe stream are position, direction, surface\_norm, energy, id, and surf\_missed.

The output bpipe stream has the direction field modified to include the scatter offset.

The log file contains output triggered by the various *debug* flags.

### NEW STYLE SCATTER

This behavior is triggered by the presence of the EsaLinAsym value in the scat\_alg field of the *scatter\_db* for a given zone. See “FILES”.

This style of scattering assumes that the scattering distributions in the *scatter\_db* cover the full range of possibilities. No extrapolation is performed. All values come from the table or from interpolating between two values in the table.

### OLD STYLE SCATTER

This mode of operation is triggered by the presence of the value EsaLinPowSym in the scat\_alg field of the *scatter\_db*. See “FILES”.

This mode duplicates the older style scattering algorithm used in the pre 2004/08 time frame. Essentially the scattering distributions in the *scatter\_db* file have lower and upper limits. So for random numbers that fall outside the limits, the scattering angle ends up being extrapolated from the distribution using a powerlaw.

## FILES

### SCATTER\_DB

The *scatter\_db* provides a lookup table mapping scattering distribution files(FITS formatted) with mirrors and zones. It also influences which scattering algorithm **scatter** uses. A list of the columns required is given below:

mirror

Mirror name, i.e. p1, p3, p4, p6, h1, h3, h4, or h6.

zone

Mirror zone name.

zone\_geom

Zone geometry specifier, currently only a linear geometry along the z axis is handled. *ZLinear* is the specifier used for this geometry.

If *ZLinear* is specified, the following additional columns are required:

scatter(l)

scatter(l)

zmin Z min of the zone for ZLinear geometry.

zmax Z max of the zone for ZLinear geometry.

scat\_alg

Scattering algorithm specifier, EsaLinPowSym or EsaLinAsym are currently accepted.

EsaLinPowSym represents the algorithm developed by LVS.

EsaLinAsym represents the algorithm developed by Zhao.

scat\_file

FITS binary table containing scattering distributions.

*MIRROR\_DB*

The *mirror\_db* parameter provides a lookup table which contains, at least, the following columns:

mirror

Name of the mirror, i.e. p1, p3, p4, p6, h1, h3, h4, or h6.

z0 Z position of the mirror.
