# calSetTelescope

Context: [caldb](#)

*Jump to:* [Description](#) [Example](#) [Bugs](#) [See Also](#)

---

## Synopsis

Sets the name of the telescope in the CALDB structure.

## Syntax

```
calSetTelescope( Caldb_Type cal, String_Type name )
```

## Description

This function sets the value of the telescope field in the CALDB structure. The case does not matter (it gets converted to upper case when actually querying the CALDB).

This field corresponds to the value of the FITS TELESCOP keyword and th mission parameter of quizcaldb; for Chandra data it should be set to "chandra".

## Example

```
chips> cal = calCreateInfo
chips> calSetTelescope( cal, "chandra" )
```

## Bugs

See the [bugs page for the caldb library](#) on the CIAO website for an up-to-date listing of known bugs.
