AHELP for CIAO 3.4

strcompress

Context: slangrtl

Jump to: Description Example See Also

Synopsis

Remove excess whitespace characters from a string

Syntax

```
String_Type strcompress (String_Type s, String_Type white)
```

Description

The strcompress function compresses the string s by replacing a sequence of one or more characters from the set white by the first character of white. In addition, it also removes all leading and trailing characters from s that are part of white.

Example

The expression

```
    strcompress (",;apple,,cherry;,banana", ",;");
```

returns the string "apple,cherry,banana".
