strjoin

Context: [slangrtl](#)

Jump to: [Description](#) [Example](#) [See Also](#)

Synopsis

Concatenate elements of a string array

Syntax

```
String_Type strjoin (Array_Type a, String_Type delim)
```

Description

The strjoin function operates on an array of strings by joining successive elements together separated with a delimiter delim. If delim is the empty string "", then the result will simply be the concatenation of the elements.

Example

Suppose that

```
days = [ "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat", "Sun" ];
```

Then strjoin (days, "+") will produce "Sun+Mon+Tue+Wed+Thu+Fri+Sat+Sun". Similarly, strjoin (["", "", ""], "X") will produce "XX".
