strstr

Context: [slangrtl](#)

Jump to: [Description](#) [Example](#) [See Also](#)

Synopsis

Replace a character with another in a string.

Syntax

```
String_Type strstr (String_Type s, Integer_Type pos, Integer_Type ch)
```

Description

The strstr character may be used to substitute the character ch for the character at position pos of the string s. The resulting string is returned.

Example

```
define replace_spaces_with_comma (s)
{
  variable n;
  while (n = is_substr (s, " "), n) s = strstr (s, n, ',');
  return s;
}
```

For uses such as this, the strtrans function is a better choice.

The first character in the string s is specified by pos equal to 1.
