## **Caveat Regarding Off-axis Angle Theta and Phi**

Return to: Data Caveats Index

All event files processed using a standard data processing version prior to DS6.9 (released on 10 August 2002, <u>please see release notes for DS6.9</u>) have the off-axis angle THETA and rotation angle (azimuth) PHI values switched. This occurs in both ACIS and HRC data. Using <u>dmcoords</u> to find the off-axis angle of your source yields correct results, no matter what processing version was used on your data. However tools such as <u>dmstat</u> when used with data processed before DS6.9 will give results with THETA and PHI switched.

Please see our thread <u>A Note on Processing Versions</u> for instructions on how to check which processing version was used on your data.
