EXPOSURE and EXPOSURn

In principle, EXPOSURn is an <u>ACIS</u> header keyword whose value for CCD_ID = n (where n = 0, 1, 2, ..., 9) includes not only the dead-time correction used to compute the value of <u>LIVETIME</u>, but also all other adjustments to the effective observing time. In practice, the values of EXPOSURn and LIVTIMEn are identical. The value of the keyword EXPOSURE is the same as the value of the EXPOSURn of the CCD at the aimpoint of the telescope.

If an observation uses interleaved mode, then there are separate values of EXPOSURn and EXPOSURE for the short and long frames.

The Observation Times entry explains how the various exposure keywords are related.

The Chandra X-Ray Center (CXC) is operated for NASA by the Smithsonian Astrophysical Observatory.
